Outline

- I. Introduction
- II. Earth observation
- III. Applications in water, agriculture and forestry
- IV. Satellite data / research in Laboratoire de Physique de l'Atmosphère (UAC)
- V. Conclusion and perspectives

I- Introduction

- Earth observation provides important decision-making bases for environmental protection, climate, land use, coastal monitoring, disaster management and sustainable development.
- Components of Earth observation
- Major Earth observation missions
- Satellite data
- Satellite data offer crucial tools for tackling specific water, agriculture, forestry and air quality challenges around the world, and particularly in Africa.

III- Earth observation (Satellite for water applications)

Water Resources Management

* Reservoir and river monitoring

* Flood zone mapping

* Water quality monitoring

MetOp satellites ; The Jason series ; SWOT ;Meteosat satellites ;

III- Earth observation (Satellite for agriculture applications)

Optimization of farming practices

- * Crop monitoring
- * Irrigation Management
- * Crop Forecasting

Sentinel-2 ; Sentinel-3 ; Landsat ;

III- Earth observation (Satellite for forestry applications)

Sustainable Forest Management

- * Deforestation Monitoring

- * Forest Fire Monitoring

- * Habitat Mapping

MetOp satellites ; Sentinel-2 ; Sentinel-3;

IV- Satellite data / research in Laboratoire de Physique de l'Atmosphère (UAC)

The regional-scale model WRF-ARW is applied to the Guinea coast for a SB convection study on 07 February 2018, to assess the atmospheric dynamics in the SB convergence zone (SBCZ).

The model outputs are evaluated with reanalysis and observational data obtained respectively from ERA5 and two weather stations (Cotonou and Bohicon).

IV- Satellite data / research in Laboratoire de Physique de l'Atmosphère (UAC)

A systematic evaluation of the performance of the WWLLN in northern Benin is carried out using data from the lightning detection network (LINET) data as ground truth.

The results show that the WWLLN is capable of locating both cloud-to-ground (CG) and inter-cloud (IC) lightning.

V- Conclusion and perspectives

The data provided by EUMETSAT satellites are extremely useful for Earth Observation

MTG to continue studies requiring upper air measurements: study underway on numerical simulation of sea breezes using the WRF model to further analyze SBF (to be compared with conditions simulated by the model)..

MTG to better study lightning and thunderstorms.

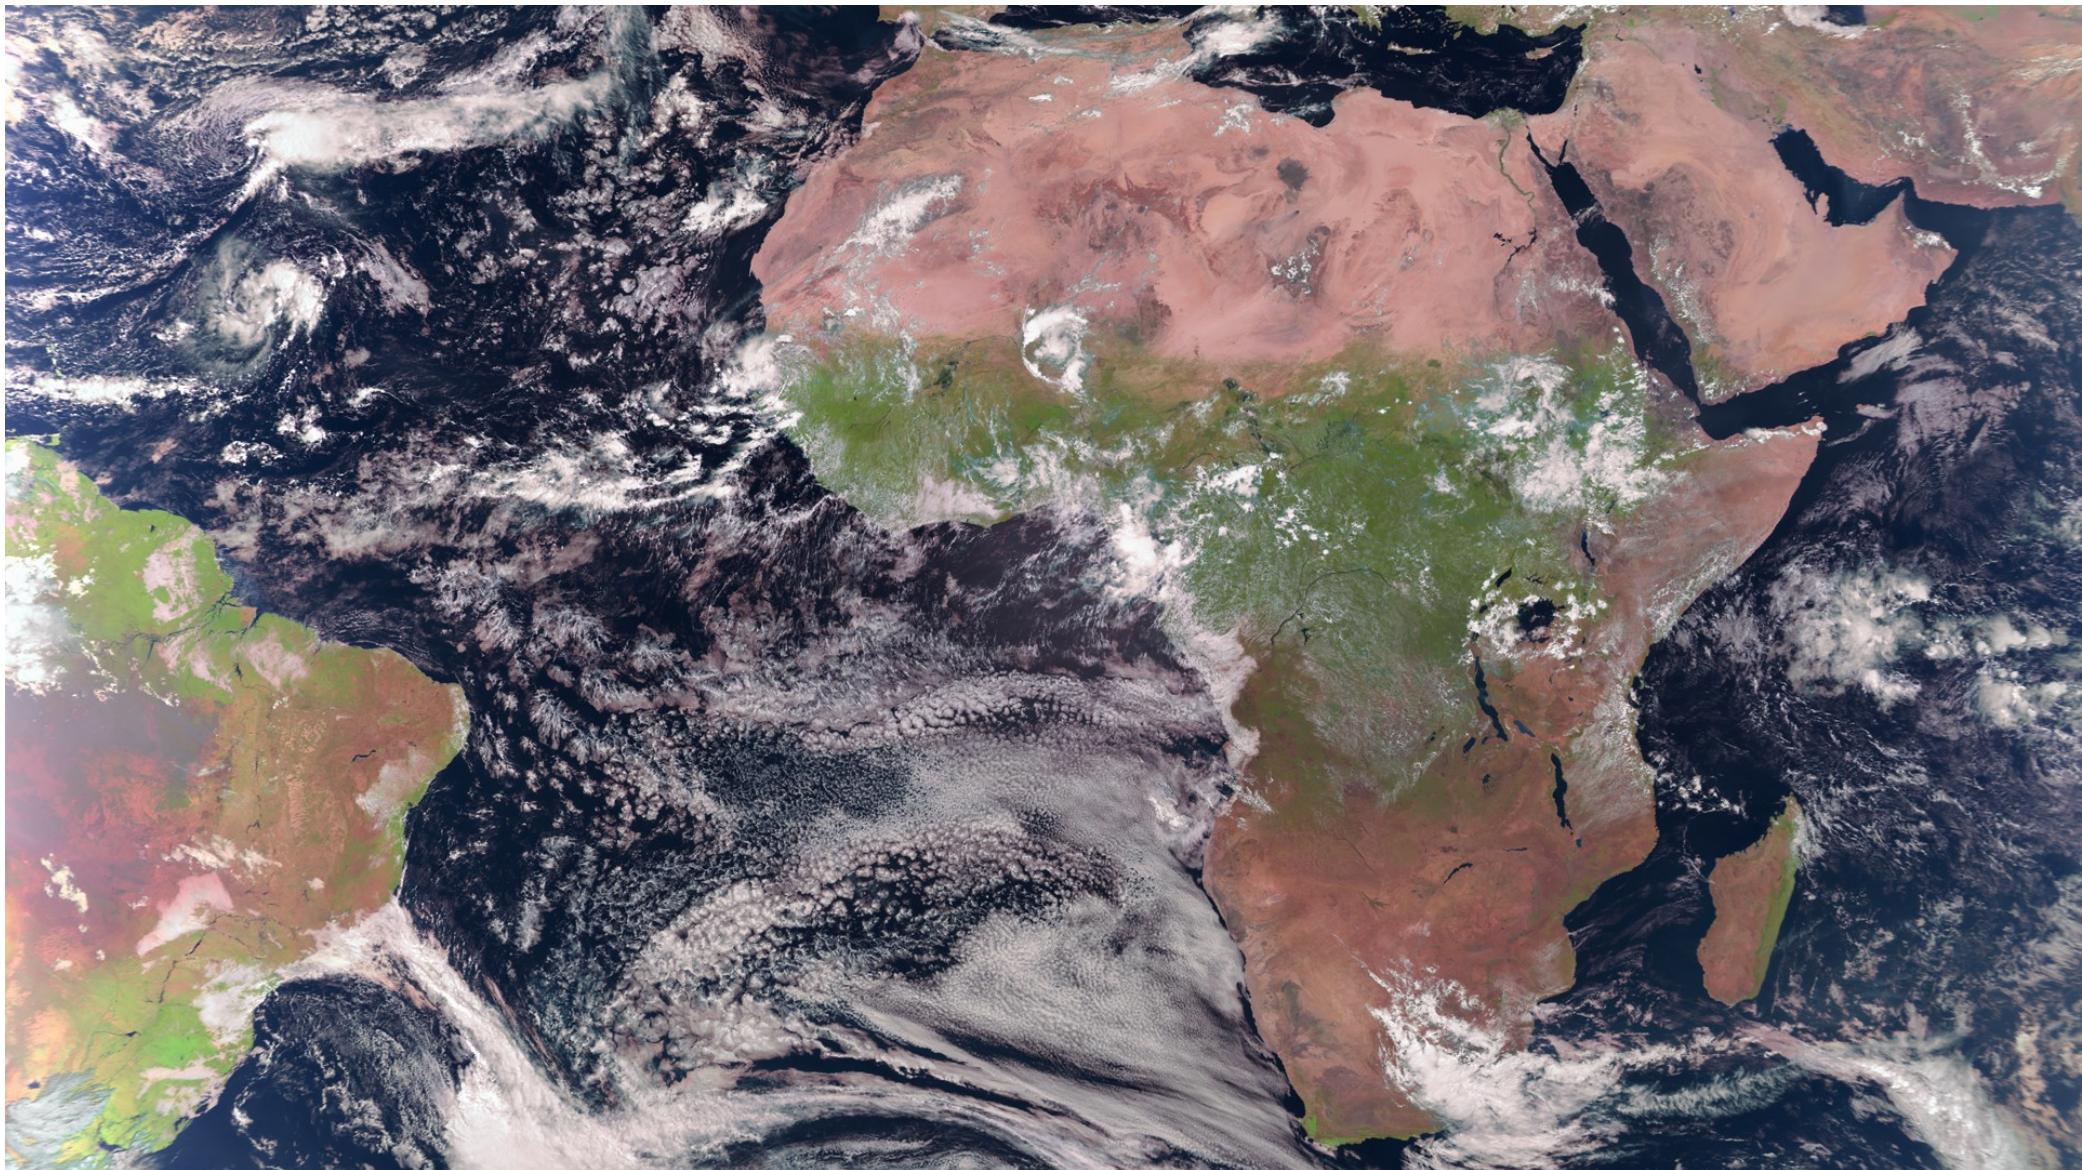

For the research laboratories of our universities, the main challenges are access to quality data and the need to focus our research on certain areas of expertise to exploit and better interpret the data in order to integrate them properly into our regional and national policies and practices.

V- Conclusion and perspectives

Perspectives :

Capacity building: Training and development of local capacities in collaboration with universities to use data for scientific research.

International collaboration: Strengthening and promoting partnerships to share data, resources and best practices.

Meteosat-11 weather satellite on 17 September 2024.

THANK YOU
